

# GUIDANCE DOCUMENT ON eHEALTH IN WOUND CARE

**eHealth in Wound Care - From conception to implementation** is a new document aiming to support the wound care professionals' interest and engagement in the development of eHealth solutions to benefit patients, health care professionals, and health care systems.

The document includes an introduction to terminology, a method for evaluation of eHealth solutions, an overview of available evidence, a discussion about the barriers and facilitators for the use of eHealth in wound care, and a road map for implementation in clinical practice.

The document is a joint publication by EWMA and the Australian Wound Management Association, developed in connection with the United4health project, [www.united4health.eu](http://www.united4health.eu).

It was published in April 2015 as an online supplement of the Journal of Wound Care and can be downloaded free of charge at [www.ewma.org](http://www.ewma.org)

*The project United4Health is partially funded under the ICT Policy Support Programme (ICT PSP) as part of the Competitiveness and Innovation Framework Programme by the European Commission*
